

Ver. 3 -2022

The Snakebite Committee has not been able to proceed with its programmes in an uninterrupted fashion because of involvement of its members in other professional activities that limit time available for work in this committee. Another, more recent, problem has been that members are scattered throughout the Island making it difficult to meet physically. This problem has been resolved, but not entirely, by the members communicating through e-mail, and more recently, meeting on virtual platforms. Despite these barriers what is encouraging, is that there are a number of younger members, researchers, who are interested in snakes, their venoms and managing bites, and above all, are willing to share their knowledge and work as a team. So, the future of the SLMA Expert Committee on Snakebite (SBC) is assured.
